1 Data Structures

1.1 BIT2D

```
#include <bits/stdc++.h>
using namespace std;

const int MAXN = 1e3 + 5;

struct BIT2D {
	int bit[MAXN][MAXN];

	void update(int X, int Y, int val){
		for(int x = X; x < MAXN; x += x&(-x))
			for(int y = Y; y < MAXN; y += y&(-y))
				bit[x][y] += val;
	}

	int query(int X, int Y){
		int sum = 0;
		for(int x = X; x > 0; x -= x&(-x))
			for(int y = Y; y > 0; y -= y&(-y))
				sum += bit[x][y];
		return sum;
	}

	void updateArea(int xi, int yi, int xf, int yf, int val){
		update(xi,   yi,    val);
		update(xf+1, yi,   -val);
		update(xi,   yf+1, -val);
		update(xf+1, yf+1,  val);
	}

	int queryArea(int xi, int yi, int xf, int yf){
		return query(xf, yf) - query(xf, yi-1) - query(xi-1, yf) +
		    query(xi-1, yi-1);
	}
};

/*
Syntax:
Bit.update(x, y, v);    //Adiciona +v na posi  o {x, y} da BIT
Bit.query(x, y);                  //Retorna o somatorio do retangulo de
    inicio {1, 1} e fim {x, y}
Bit.queryArea(xi, yi, xf, yf);      //Retorna o somatorio do retangulo de
    inicio {xi, yi} e fim {xf, yf}
Bit.updateArea(xi, yi, xf, yf, v); //adiciona +v no retangulo de inicio {xi
    , yi} e fim {xf, yf}

IMPORTANTE! UpdateArea N O atualiza o valor de todas as c lulas no
    ret ngulo!!! Deve ser usado para Color Update
IMPORTANTE! Use query(x, y) Para acessar o valor da posi  o (x, y) quando
    estiver usando UpdateArea
IMPORTANTE! Use queryArea(x, y, x, y) Para acessar o valor da posi  o (x,
    y) quando estiver usando Update Padr o
*/
```

1.2 BIT2D Sparse

```
#include <bits/stdc++.h>
using namespace std;

#define pii pair<int, int>
#define upper(v, x) (upper_bound(begin(v), end(v), x) - begin(v))

struct BIT2D {
	vector<int> ord;
	vector<vector<int>> bit, coord;

	BIT2D(vector<pii> pts){
		sort(begin(pts), end(pts));

		for(auto [x, y] : pts)
			if(ord.empty() || x != ord.back())
				ord.push_back(x);

		bit.resize(ord.size() + 1);
		coord.resize(ord.size() + 1);

		sort(begin(pts), end(pts), [&](pii &a, pii &b){
			return a.second < b.second;
		});

		for(auto [x, y] : pts)
			for(int i=upper(ord, x); i < bit.size(); i += i&-i)
				if(coord[i].empty() || coord[i].back() != y
				    )
					coord[i].push_back(y);

		for(int i=0; i<bit.size(); i++) bit[i].assign(coord[i].size
		    ()+1, 0);
	}

	void update(int X, int Y, int v){
		for(int i = upper(ord, X); i<bit.size(); i += i&-i)
			for(int j = upper(coord[i], Y); j < bit[i].size();
			    j += j&-j)
				bit[i][j] += v;
	}

	int query(int X, int Y){
		int sum = 0;
		for(int i = upper(ord, X); i > 0; i -= i&-i)
			for(int j = upper(coord[i], Y); j > 0; j -= j&-j)
				sum += bit[i][j];
		return sum;
	}

	void updateArea(int xi, int yi, int xf, int yf, int val){
		update(xi,   yi,    val);
		update(xf+1, yi,   -val);
		update(xi,   yf+1, -val);
		update(xf+1, yf+1,  val);
	}

	int queryArea(int xi, int yi, int xf, int yf){
		return query(xf, yf) - query(xf, yi-1) - query(xi-1, yf) +
		    query(xi-1, yi-1);
	}
};

/***********************************
Sparse Binary Indexed Tree 2D

Recebe o conjunto de pontos que ser o usados para fazer os updates e
as queries e cria uma BIT 2D esparsa que independe do "tamanho do grid".

IMPORTANTE! O c digo deve ser OFFLINE

Complexity:
Build: O(N Log N) (N -> Quantidade de Pontos)
Query/Update: O(Log N)

BIT2D(pts);   // pts -> vecotor<pii> com todos os pontos em que ser o
    feitas queries ou updates

        int m = (l+r)/2;

        if(sum >= k) return kth(Left->L, Right->L, l, m, k);

        return kth(Left->R, Right->R, m+1, r, k - sum);
}

/*******************************************************
-> Segment Tree Persistente com:
        - Query em Range
        - Update em Ponto

Build(1, N) -> Cria uma Seg Tree completa de tamanho N; RETORNA um *
    Ponteiro pra Ra z
Update(Root, 1, N, pos, v)      -> Soma +V na posi  o POS; RETORNA um *
    Ponteiro pra Ra z da nova vers o;
Query(Root, 1, N, a, b)         -> RETORNA o valor calculado no range [a, b
    ];
Kth(RootL, RootR, 1, N, K)      -> Faz uma Busca Bin ria na Seg; Mais
    detalhes abaixo;

[ Root -> N   Raiz da Vers o da Seg na qual se quer realizar a opera  o
    ]

Para guardar as Ra zes, use:
-> vector<Node*> roots; ou
-> Node* roots [MAXN];

Build:  O(N)
Query:  O(log N)
Update: O(log N)
Kth:    O(Log N)

Comportamento do K-th(SegL, SegR, 1, N, K):
        -> Retorna  ndice  da primeira posi  o i cuja soma de prefixos
            [1, i]    >= k
        na Seg resultante da subtra  o dos valores da (Seg R) - (Seg L).
        -> Pode ser utilizada para consultar o K- simo  menor valor no
            intervalo [L, R] de um array.
        Para isso a Seg deve ser utilizada como um array de frequ ncias.
            Comece com a Seg zerada (Build).
        Para cada valor V do Array chame um update(roots.back(), 1, N, V,
            1) e guarde o ponteiro da seg.
        Para consultar o K- simo  menor valor de [L, R] chame kth(roots[L
            -1], roots[R], 1, N, K);

IMPORTANTE! Cuidado com o Kth ao acessar uma Seg que est  esparsa (RTE).
    Nesse caso,
```

```
chame o Build antes ou garanta criar os n s L e R antes de acess -los (
     como na query).
*********************************************************/
```

1.7 Sparse Table

```
#include <bits/stdc++.h>

	    foi atingido o Fluxo M ximo
	A DFS retorna um poss vel aumento do Fluxo
*************************************/
/*************************************
* Use Cases of Flow

+ Minimum cut: the minimum cut is equal to maximum flow.
  i.e. to split the graph in two parts, one on the source side and another
      on sink side.
  The capacity of each edge is it weight.

+ Edge-disjoint paths: maximum number of edge-disjoint paths equals maximum
     flow of the
  graph, assuming that the capacity of each edge is one. (paths can be
      found greedily)

+ Node-disjoint paths: can be reduced to maximum flow. each node should
     appear in at most one
  path, so limit the flow through a node dividing each node in two. One
      with incoming edges,
  other with outgoing edges and a new edge from the first to the second
      with capacity 1.

+ Maximum matching (bipartite): maximum matching is equal to maximum flow.
    Add a source and
  a sink, edges from the source to every node at one partition and from
      each node of the
  other partition to the sink.

+ Minimum node cover (bipartite): minimum set of nodes such each edge has
    at least one
  endpoint. The size of minimum node cover is equal to maximum matching (
      K o n i g s  theorem).

+ Maximum independent set (bipartite): largest set of nodes such that no
    two nodes are
  connected with an edge. Contain the nodes that aren't in "Min node cover"
       (N - MAXFLOW).
```

```
+ Minimum path cover (DAG): set of paths such that each node belongs to at
     least one path.
  - Node-disjoint: construc a matching where each node is represented by
       two nodes, a left and
    a right at the matching and add the edges (from l to r). Each edge in
         the matching
    corresponds to an edge in the path cover. The number of paths in the
         cover is (N - MAXFLOW).
  - General: almost like a minimum node-disjoint. Just add edges to the
       matching whenever there
    is an path from U to V in the graph (possibly through several edges).
  - Antichain: a set of nodes such that there is no path from any node to
       another. In a DAG, the
    size of min general path cover equals the size of maximum antichain (
         D i l w o r t h s  theorem).
